

JobQGenie ~ the perfect companion for your HA solution

JobQGenie is the key to a simple and speedy recovery following a system failure or role swap situation. For users of IBM 'i', it captures Job Queue content for replication between systems, relying on the latest IBM technology.

Designed to work alongside your high availability product, JobQGenie tracks jobs through their life cycle. Following a system failure, it is possible to use the tools provided within JobQGenie to identify the data position and take the required action to bring the data back to a state where the job can be re-submitted.

JobQGenie is the only product that captures and stores job information for automated re-submission and effective application recovery.

Shield's customers confirm:

"I don't even bother to check the status anymore, it just works!"

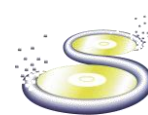

".....with over 300,000 jobs in the overnight batch which ran for less than a few seconds each. JobQGenie ran without a problem, using very little CPU".

"Support staff liked being able to review the collected data to ensure no jobs ended abnormally before the role swap occurred".

"At the time of our last system failure we had our HA tool running, but without JobQGenie we could not switch to the target because the job queues were filling up and not processing fast enough."

"Our role swap has gone from 30 hours to seven minutes."

- Low overhead, even in high activity environments
- Reduces downtime
- Allows easy re-submission of failed jobs
- Handles 30,000+ jobs per hour
- Automated tools provide fast recovery
- Download 30-day free trial
