

JobQGenie

~ the perfect companion to your HA solution

Maximize your HA solution and build on your investment!

An IBM Advanced
Business Partner

JobQGenie is a critical tool
for users of IBM system i5
High Availability Software
or supportive technology.
This ingenious tool is the

key to simple and speedy recovery following a system
failure. Simple to install, JobQGenie needs very little
management once it has been configured.

“ High Availability software provides excellent data replication, but doesn't match that data with your application. When it's time to recover, you are on your own! ”

The only product to address the concept of application
restart, JobQGenie tracks and stores critical
information about each job as it progresses through its
life cycle. With the aid of JobQGenie users can identify
the state of each job and its associated data when a
failure occurred. Understanding this information allows
a clear route to recover and restart the application.

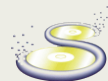

**Assists with application
restart**

**Reduces downtime and
loss of integrity**

**Tracks all or specific
Job Queues**

**Eases resubmission of
failed jobs**

**Runs virtually
maintenance free**
